

Date:

Alex snorted. “Did it just say pizza?”

“It sure did,” I said, blinking. “I think we forgot to teach it how to find actual gardening info.”

See, without the right data—like weather or plant databases—AI just makes a silly guess. It’s like asking a penguin for lunch advice.

So we connected a weather site, added a gardening list, and updated the code with something called **predictive analysis**. That’s when AI looks at real info to make smart suggestions.

Then we tried again:

“This week is sunny and warm. Try planting basil or cherry tomatoes!”

Success. We high-fived. Even I felt warm inside, and I don’t even have a heart.

That weekend, Ms. Davis’s garden club was full of people. They brought seeds, tools, and big smiles.

“You helped me grow my club,” she said. “Not just my garden.”

And that’s how Garden Buddy saved the day—with a little teamwork, a lot of coding, and zero pizza plants.

Vocabulary

- **Chatbot** : A computer program that talks with people to help or answer questions
- **Artificial Intelligence** (AI): Smart technology that learns, solves problems, and makes decisions
- **Predictive Analysis**: When AI uses real information to make a smart guess
- **Programming** :Programming is how we give instructions to a computer or robot so it knows what to do. It’s like writing a recipe—but instead of making cookies, you’re telling a machine how to move, talk, or solve a problem!
